Q1 There are 416 postal codes

Q2

Q3. The majority of points location are clustered in the east York region particularly around Danforth avenue.

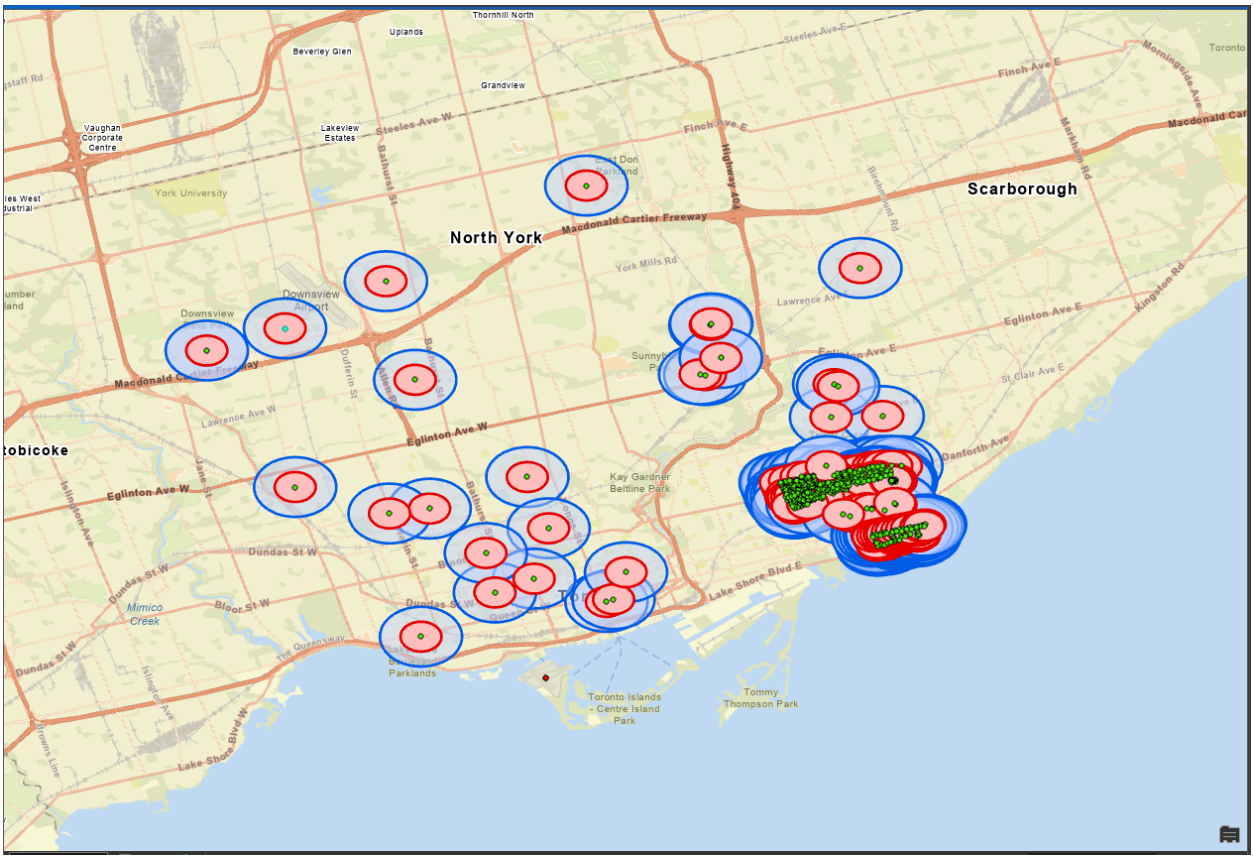

Q4 There are 312 point locations that fall into the M4C forward sortation area.

Q5

Postal code - M5C 1J3

Distance = 2968.08 / 1000 = 2.97km

Q6

Q7

A) Looking at the two buffers around M3K 0C3, The 500m buffer doesn't really capture much greenspace at all and it's mostly just residential buildings and streets. It looks really developed and urban. The 1km buffer captures more green space. It includes part of Downsview Park and the airport area. The 1km buffer captures way more greenspace while the 500m buffer barely gets any parks at all. It shows how much of a difference that extra 500 meters makes in terms of what greenspace residents can actually access.

B) I would use the 1km buffer to study the association between greenspace and physical activity levels. The 1km buffer provides a better representation of the walkable neighborhood environment and shows the greenspace that residents would reasonably access on foot for physical activity. The 500m buffer would fail to capture greenspace availability by capturing almost no parks, while the 1km buffer clearly includes Downsview Park which is within walking distance. Finally, the 1km buffer is large enough to include accessible greenspace without being so large that it captures areas residents wouldn't be able to walk to.
